Merging & Joining?

INTEGRATE
DISPARATE
DATASETS

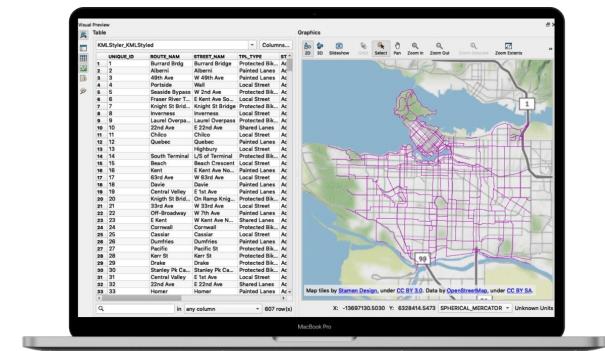

Data silos

Just because you have disconnected and different kinds of data, doesn't mean they can't be brought together.

Merging & Joining with FME

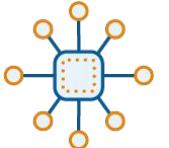

The solution
(often includes FME)

Enhanced Data!

Agenda

The Basics of Merging & Joining

Transformer Categories

6 Exercises (FME Desktop)

Easy Peasy in FME!

Today's Focus... also Easy Peasy!

There are many paths you can take in FME.

Transformer Categories

SQL-Free Transformers

- FeatureJoiner
- FeatureMerger
- DatabaseJoiner

Can be set up easily without any database knowledge

SQL-Based Transformers

- InlineQuerier
- SQLCreator
- SQLExecutor

Requires Knowledge of SQL.

Merging and Joining Tabular Data

FeatureJoiner Review

Mode	Venn Diagram	▶ Joined	▶ UnjoinedLeft	▶ UnjoinedRight
Left	A Venn diagram with two overlapping circles. The left circle is filled red and labeled 'Left'. The right circle is white and labeled 'Right'. Only the portion of the left circle that does not overlap with the right circle is shaded red.	All Matches and Unmatched Left Features	Nothing	Unmatched Right Features
Inner	A Venn diagram with two overlapping circles. Both circles are filled red and labeled 'Left' and 'Right'. Only the central overlapping area is shaded red.	All Matches ONLY	Unmatched Left Features	Unmatched Right Features
Full	A Venn diagram with two overlapping circles. Both circles are filled red and labeled 'Left' and 'Right'. Both the overlapping and non-overlapping areas of both circles are shaded red.	Everything	Nothing	Nothing

Documentation | [FeatureJoiner](#)

Tutorial | [The FeatureJoiner Transformer](#)

FeatureJoiner | Cardinality

Cardinality	Description	Output (assuming 1 key value)
1:1	One to One: If each Left feature has a single match among the Right features (for example a single point feature is mapped to an address table via a unique address ID key), this is a 1:1 match and produces a single Joined feature.	1 Left matches 1 Right: 1 Joined Feature output
1:M	One to Many: If each Left feature has multiple matches among the Right features (for example a single address record is mapped to a list of planning applications for that address), this is a 1:M (one-to-many) match and produces a Joined feature for every match that occurs.	1 Left matches 10 Right: 10 Joined Features output
M:1	Many to One: If multiple Left features match a single Right feature record (for example a number of addresses match to the same census data via a postal code field) this is a M:1 (many-to-one) match and produces a Joined feature for every match that occurs	10 Left match 1 Right: 10 Joined Features output
M:N	Many to Many: If multiple Left features match multiple Right features (for example a number of addresses match to a number of records for electrical power outages) this is a M:N (many-to-many) match and produces a Joined feature for every match that occurs.	10 Left match 10 Right: 100 Joined Features output* *When all features have identical key values - all Left match all Right.

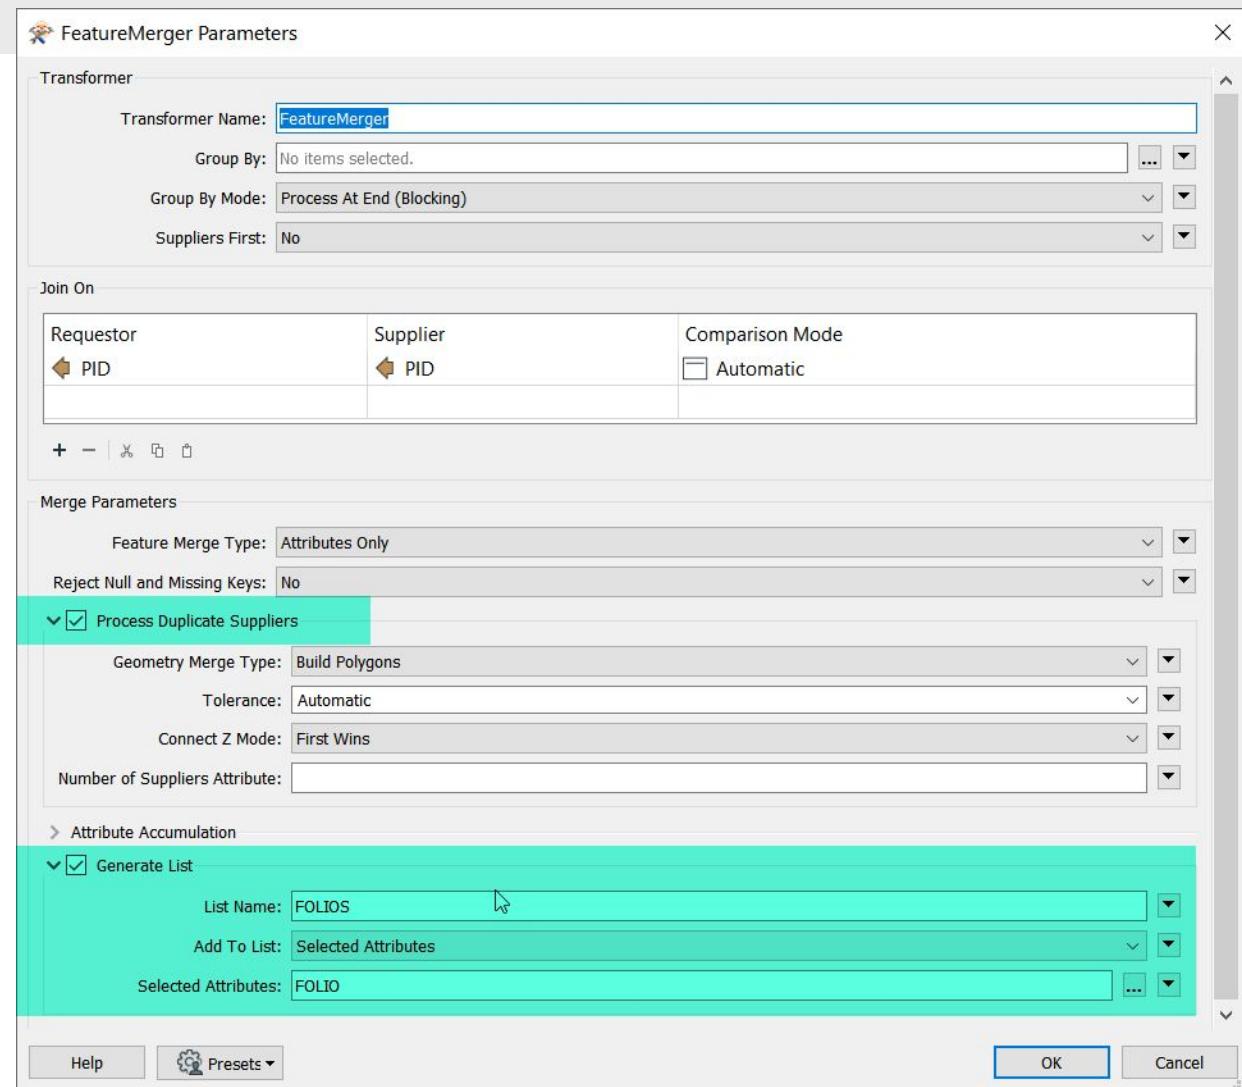

Exercise 2: FeatureMerger | Add FOLIO Numbers | 1:M Join

FeatureMerger Summary

1:M join results in a single match by default

- Generate a list of matches for each Requestor by enabling:
 - **Process Duplicate Suppliers**
 - **Generate List**
[Tutorial: Working with List Attributes](#)

Documentation | [FeatureMerger](#)
Tutorial | [The FeatureMerger Transformer](#)

FeatureJoiner

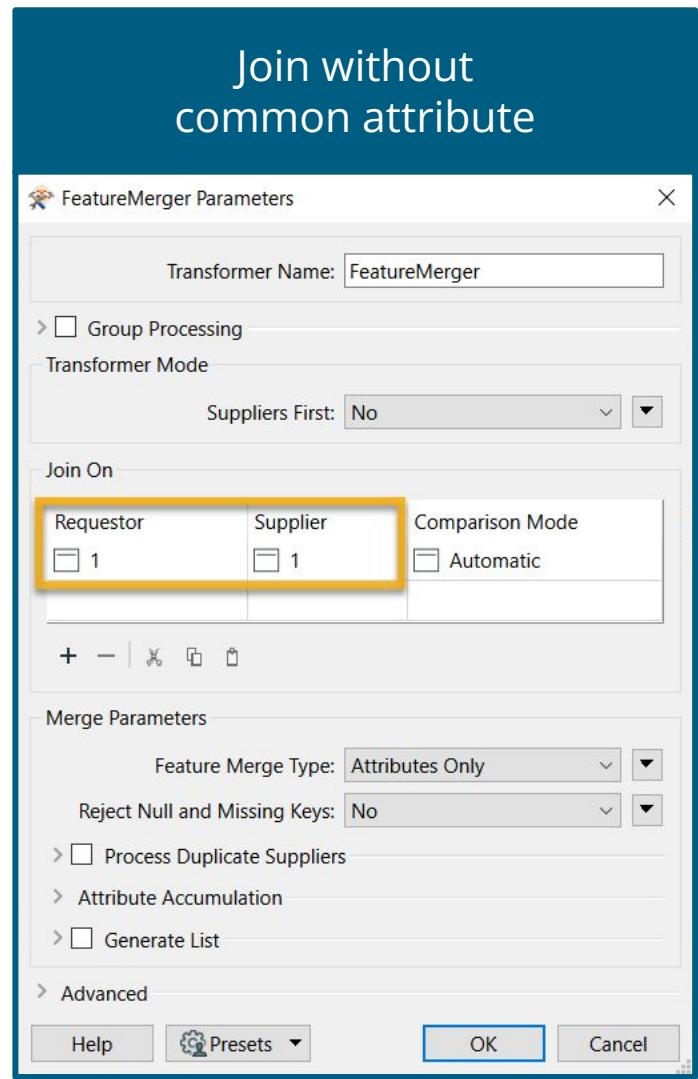

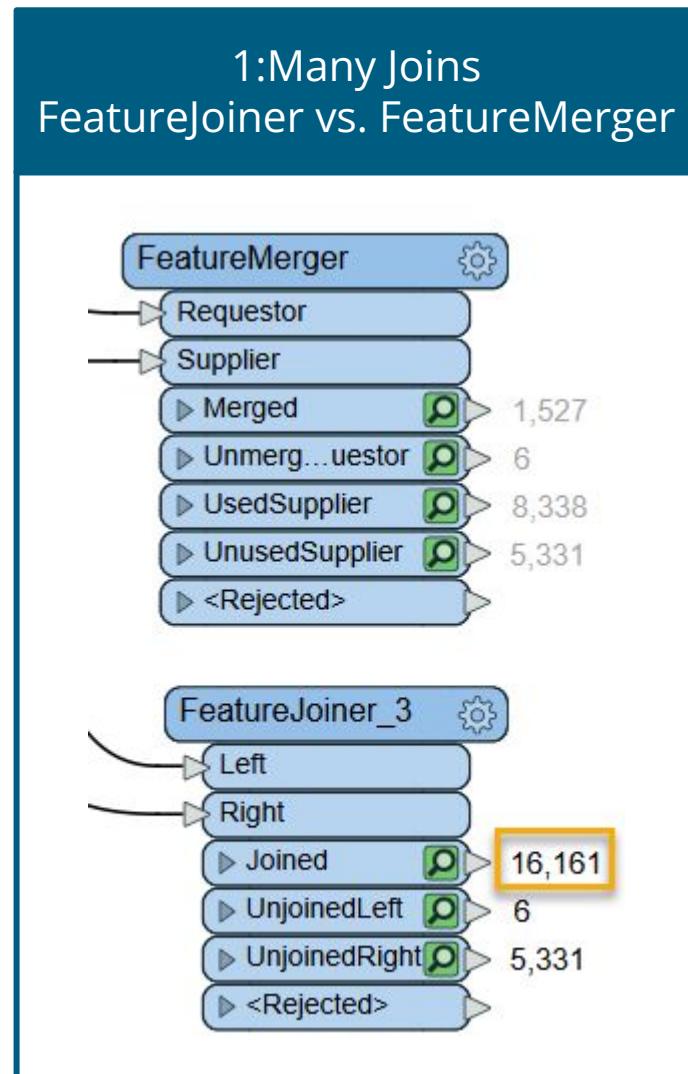

- **Simpler**, and **performs faster** than FeatureMerger
- SQL-like terminology
- Handles cardinalities easier than the FeatureMerger (ie. 1:M, M:N and M:1)
- Supports multiple matches per source (by default, 1:M results in a record for each match)
- Join Modes are more intuitive.

FeatureMerger

- Handling 1:M joins is a bit more work
- Default: Single match is output for 1:M relationship
- Generate lists of matches
- Many Suppliers can be merged on to a single Requestor.
- Drag & Drop Join Modes (connecting multiple ports)
- Can create geometries!

Extra Tips!

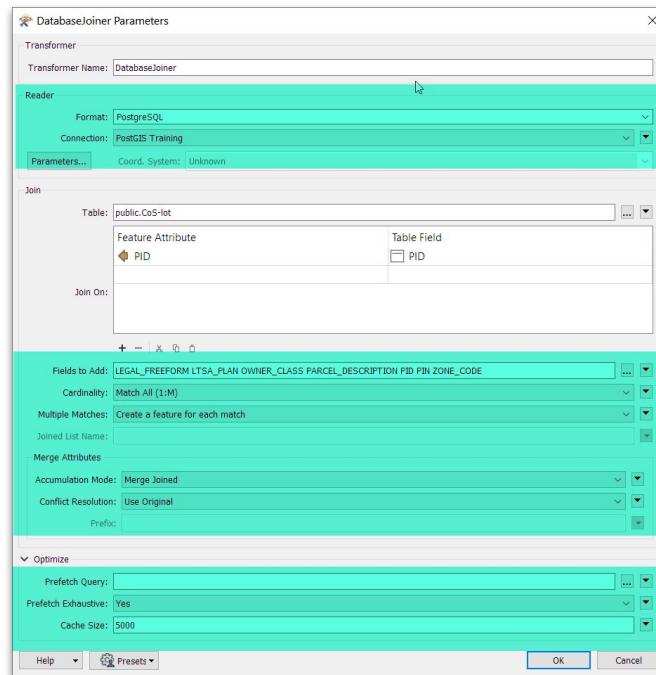

Exercise 3: DatabaseJoiner | Add Zone Descriptions

Midstream Join with DatabaseJoiner

Provides the ability to form a join against a database (incl. CSV & Excel) with an existing dataset in the workspace.

→ **Read in database formats, Excel or CSV**

→ **Matching and accumulation options**

→ **Let the database do the work by pre-filtering a subset of the table you're reading into the workspace**

DatabaseJoiner

- **Non-Blocking** - Joins data as each row flows by
- Connect to and join to database tables midstream with one easy transformer!
- Can also connect to Excel and CSV
- Select which attributes you want to join
- Explicit cardinality parameters
- Good for quick lookups - caches first 5000 records

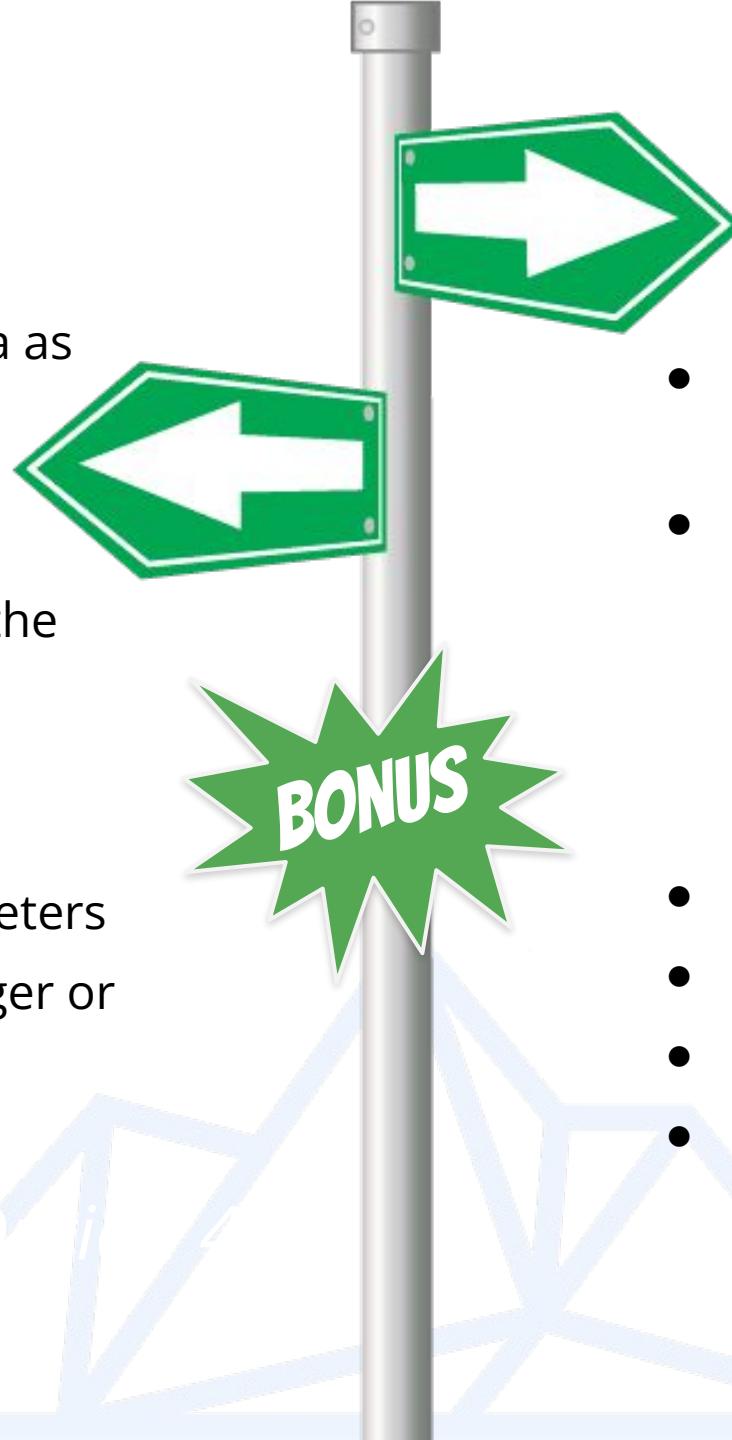

FeatureMerger/ FeatureJoiner

- **Blocking** - Wait until all data has been read before doing processing
- All FME readers can be used
 - No need for anything to be in a database
- Cardinality options vary

DatabaseJoiner

- **Non-Blocking** - Joins data as each row flows by
- Data is external to the workspace and can be changed without editing the workspace
- Can merge in multiple attributes
- Explicit cardinality parameters
- Best if the join data is larger or changing

AttributeValueMapper

- **Non-Blocking** - Joins data as each row flows by
- No external dependencies
 - Data to lookup is stored in the workspace
 - Can be imported at design time from an external source
- Only a single attribute can be added
- 1:1 lookups only
- Very fast
- Best for small, simple, stable mappings

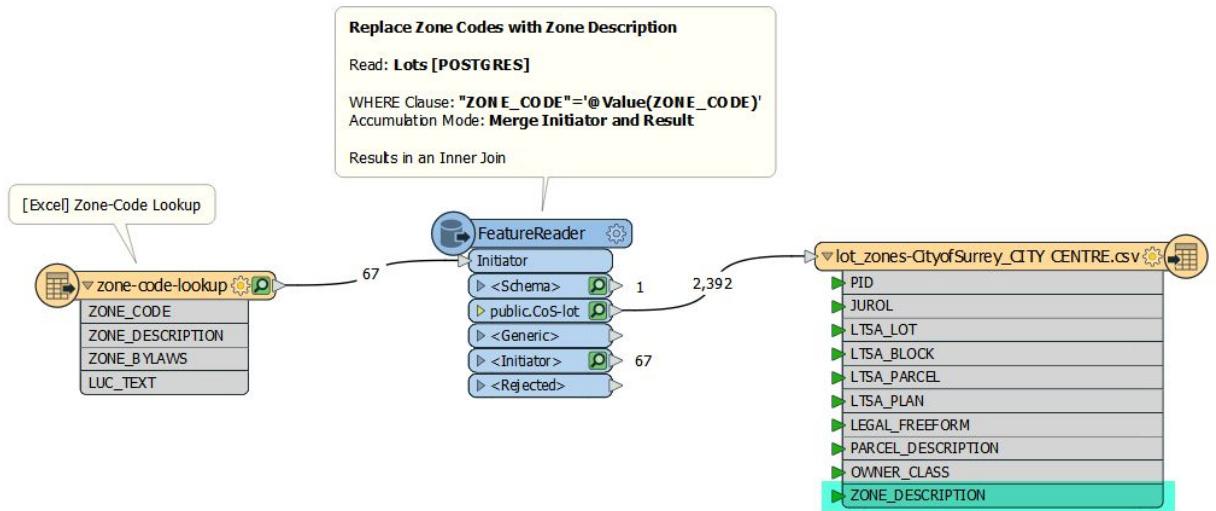

Exercise 4: Obtain Addresses & Generate Report

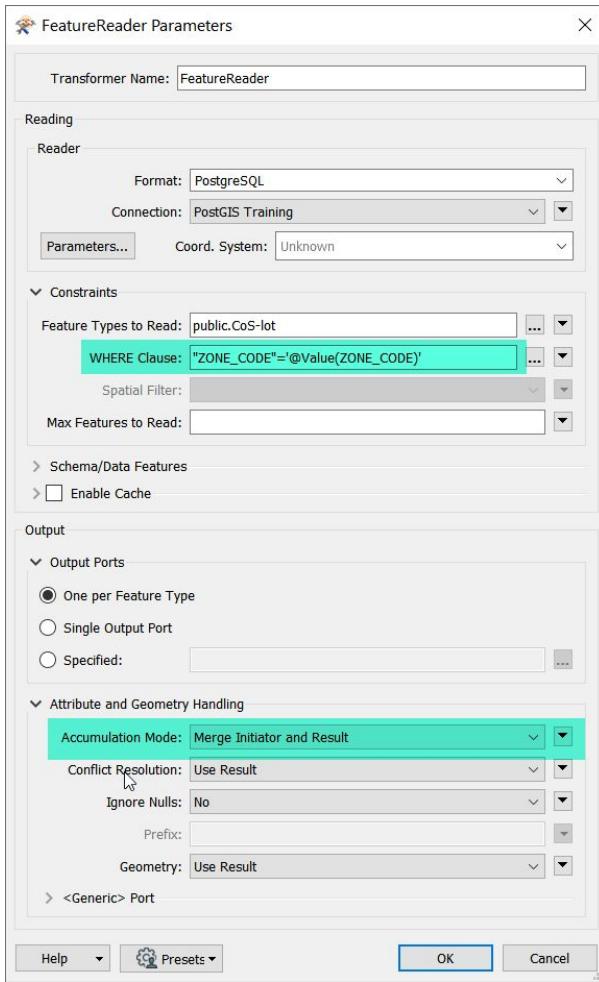

Midstream Join with FeatureReader

- Simpler midstream option
- Join against any database or spatial format
- Typically used for [spatial joins](#)
- Also used to perform tabular joins with database tables

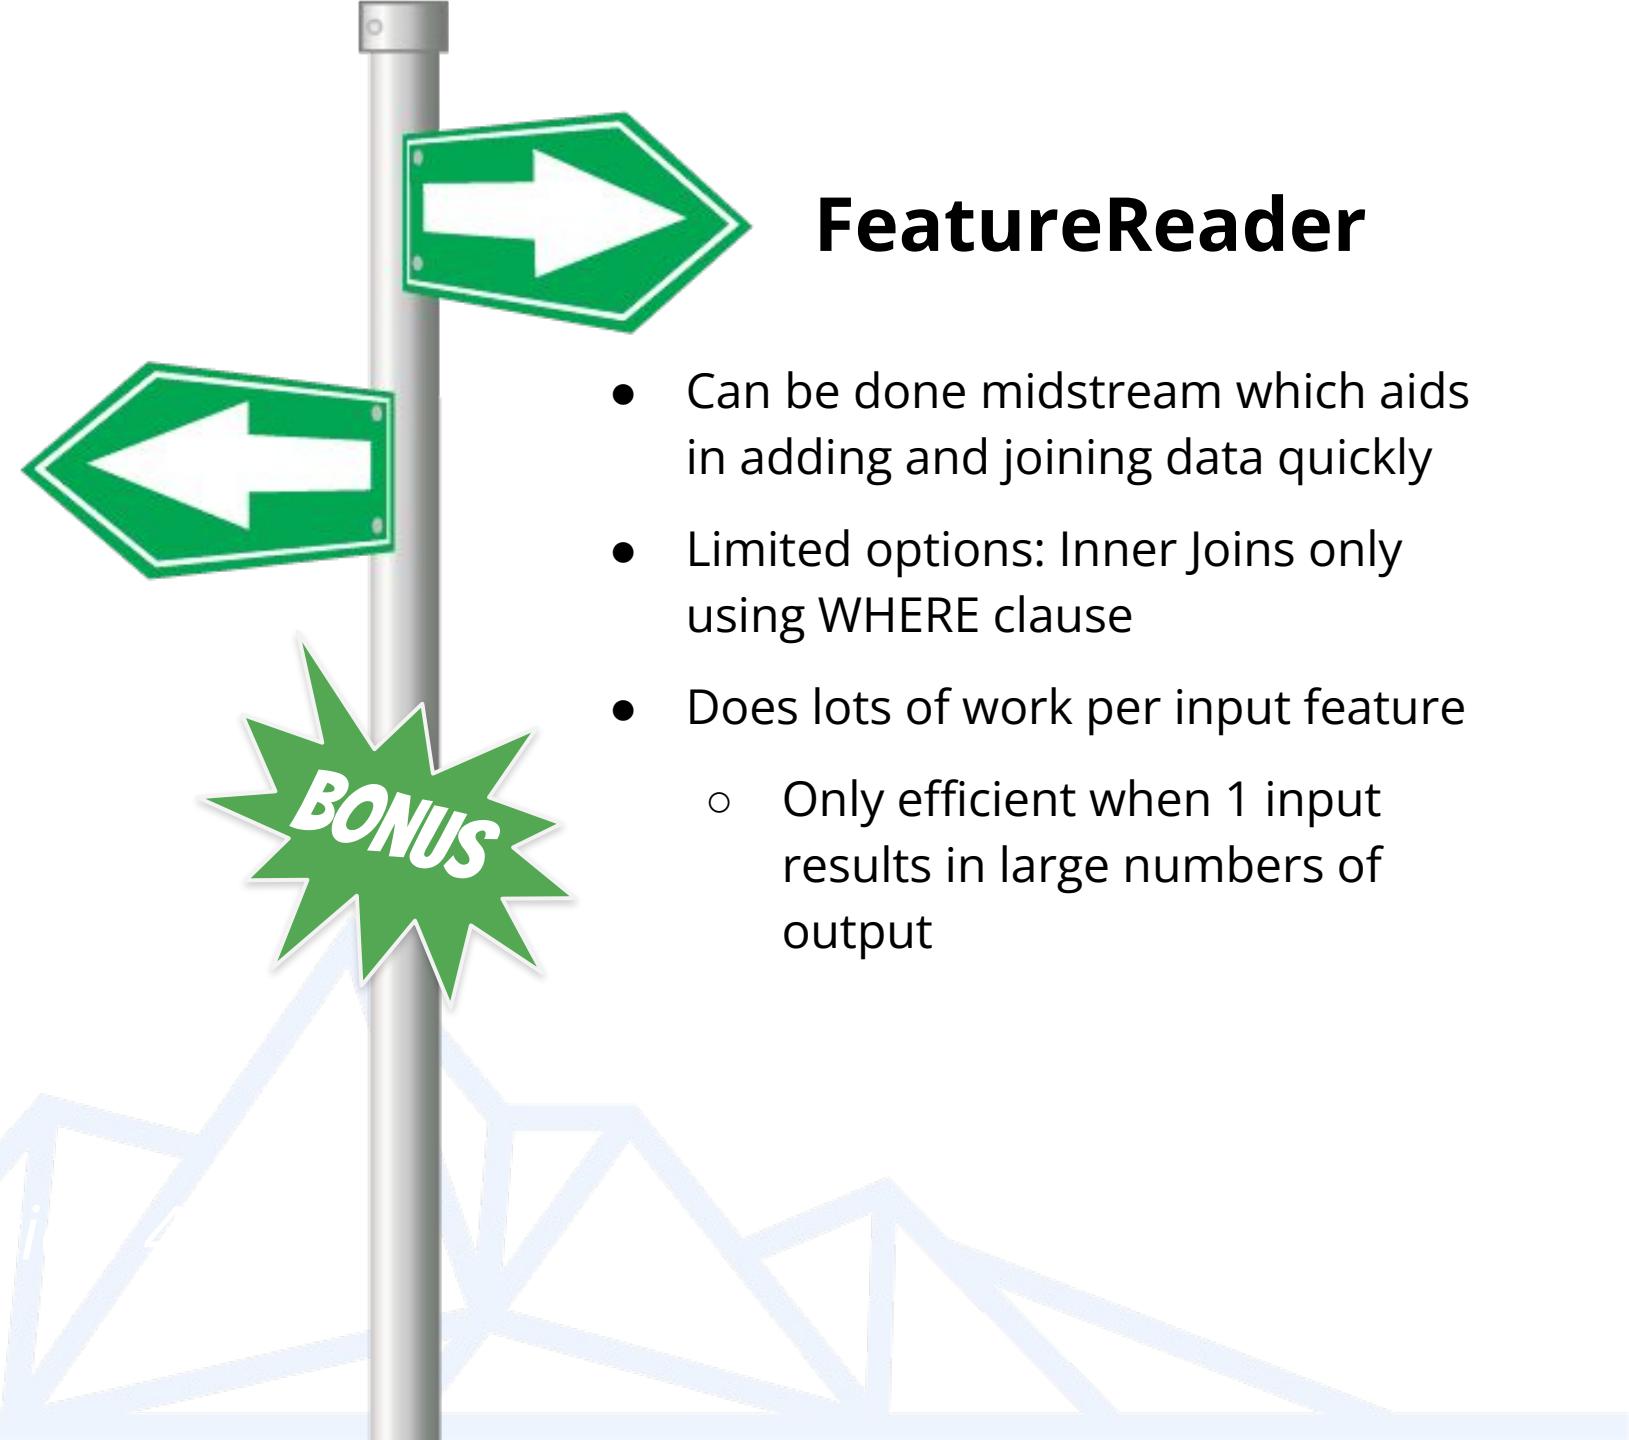

Tips for FeatureReader

1. Set the WHERE Clause to:
$$<\text{Incoming Attribute}> = '@Value(<\text{Initiator Attribute}>)'$$
2. Set **Accumulation Mode to Merge Initiator and Result**

DatabaseJoiner

- Connect to and join to database tables midstream with one easy transformer!
- Can also connect to Excel and CSV
- Select which attributes you want to join
- Explicit cardinality parameters
- Very efficient, especially when using a primed cache
 - Automatically done for File-based joins

FeatureReader

- Can be done midstream which aids in adding and joining data quickly
- Limited options: Inner Joins only using WHERE clause
- Does lots of work per input feature
 - Only efficient when 1 input results in large numbers of output

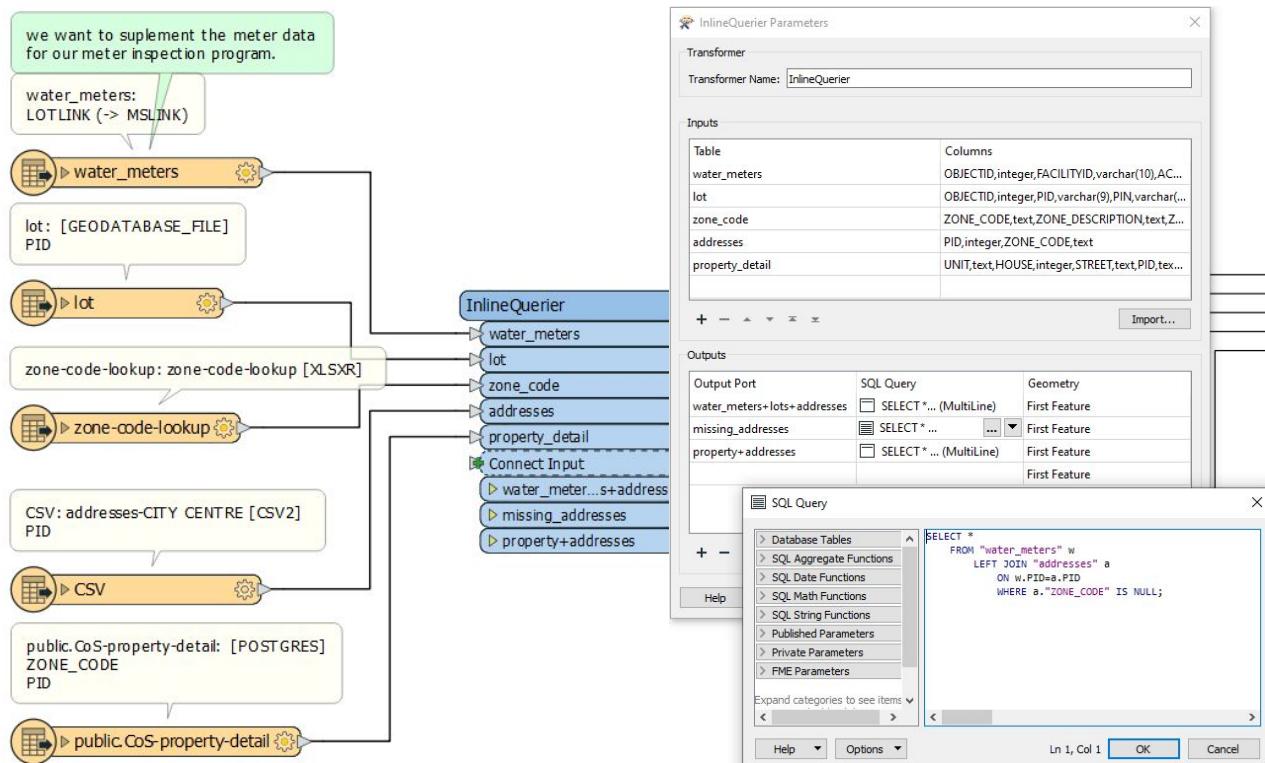

A blue-toned landscape photograph of a mountain range. The foreground features a large, dark mountain peak with a complex wireframe overlay of triangles, suggesting a digital or analytical process. In the background, other mountain peaks are visible under a clear sky.

Exercise 5: InlineQuerier | One transformer to rule them all?

InlineQuerier

Move over FeatureJoiner:

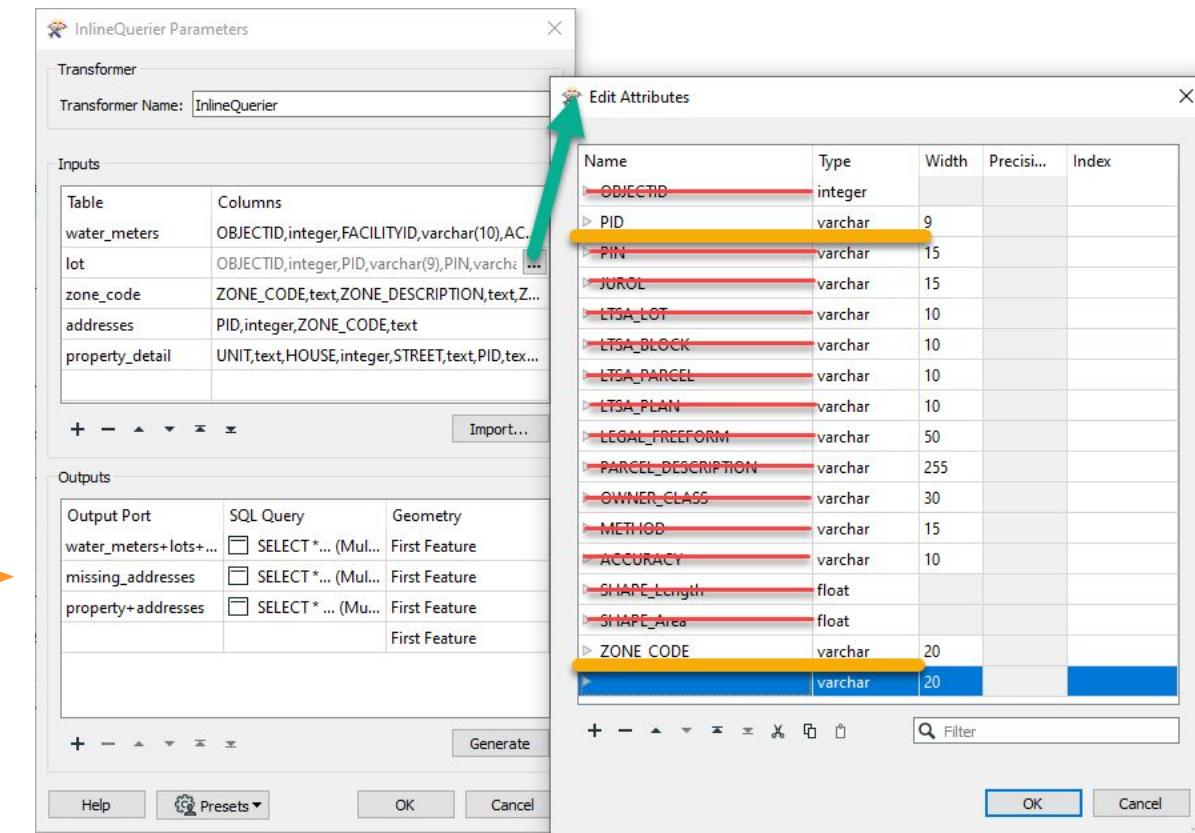

- Any data source can be used.
- Utilizes the power of SQL
- Multiple queries
- Joins data in a temporary SQLite database
- Includes spatial

[SQLite Tutorial - An Easy Way to Master SQLite Fast](#)

Tips for InlineQuerier

- Loads a temporary SQLite database - so consolidate all your queries if you can
 - Takes some time to load
 - Fast once it's loaded
- Don't use it for simple tasks, i.e. Filtering
- Use smart configuration to improve performance
 - Only define input columns needed in the queries

FeatureJoiner

- Data already loaded, any data source can be used
- Uses SQL-Free joins
- Very easy to set-up
- **Great performance**
- **No prior SQL knowledge needed**

InlineQuerier

- Data already loaded, any data source can be used
- **Utilizes the power of SQL**
- **Join data in a temporary SQLite database**
- **Multiple queries in a single transformer**
- **Great if you ❤️SQL**

A blue-toned landscape photograph of a mountain range. The foreground features a large, dark mountain peak with a complex wireframe overlay of triangles, suggesting a digital or analytical process. In the background, other mountain peaks are visible under a clear sky.

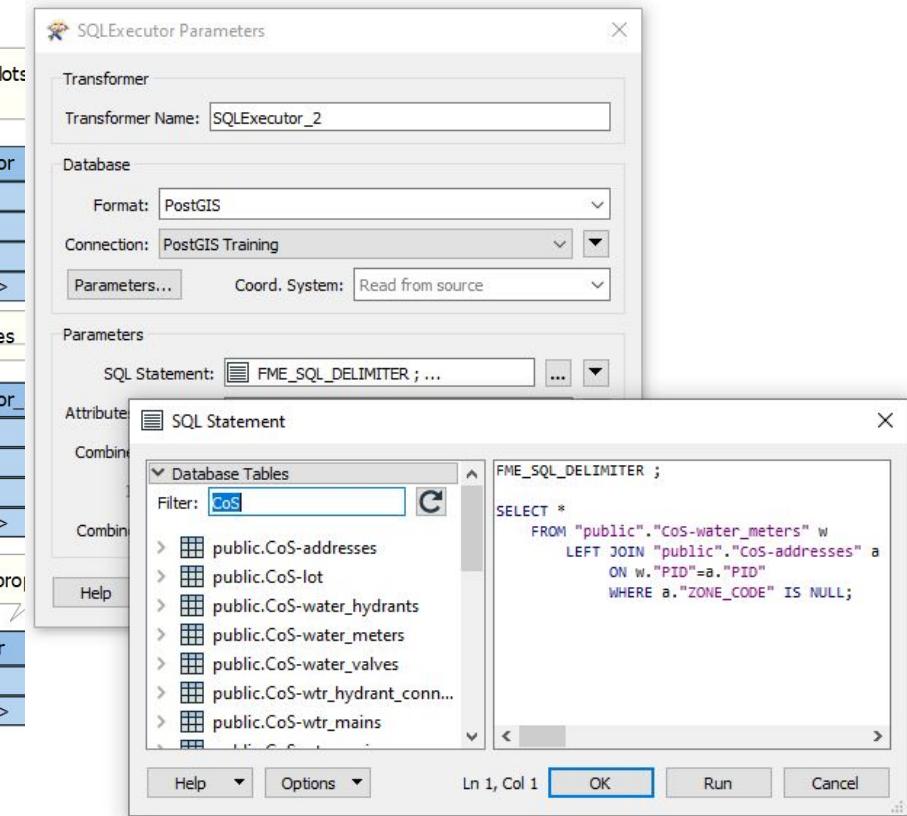

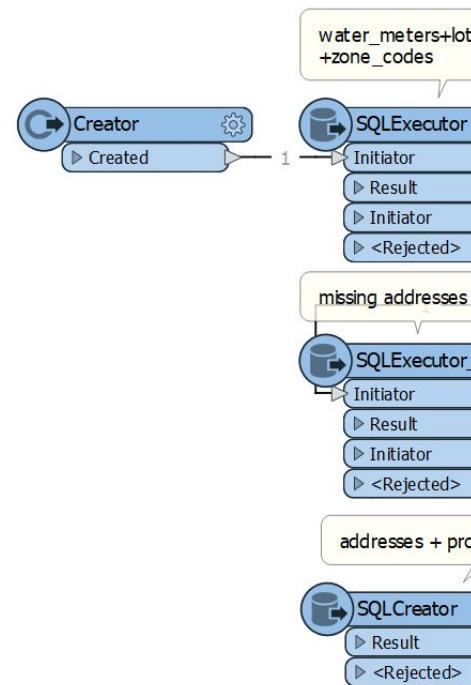

Exercise 6: SQLCreator & SQLExecutor | Let the database do the work

SQLExecutor & SQLCreator

Move over InlineQuerier

- Needs a database
- Utilizes the power of SQL
- Includes spatial
- You can use *any* SQL -
 - Select data
 - Create indices
 - Drop tables

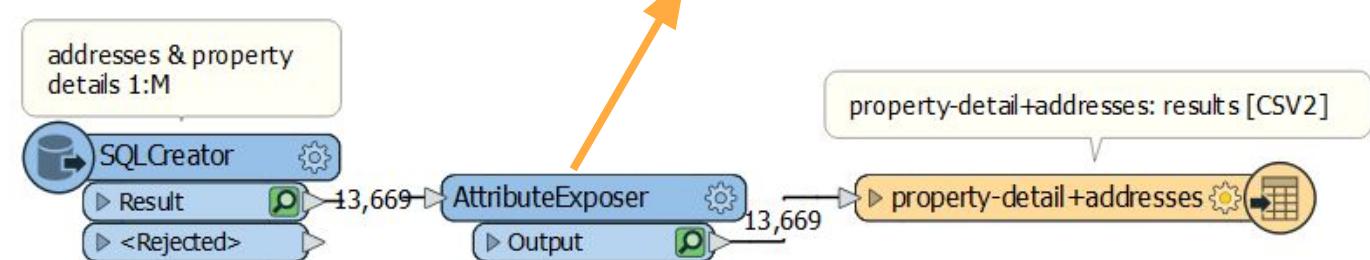

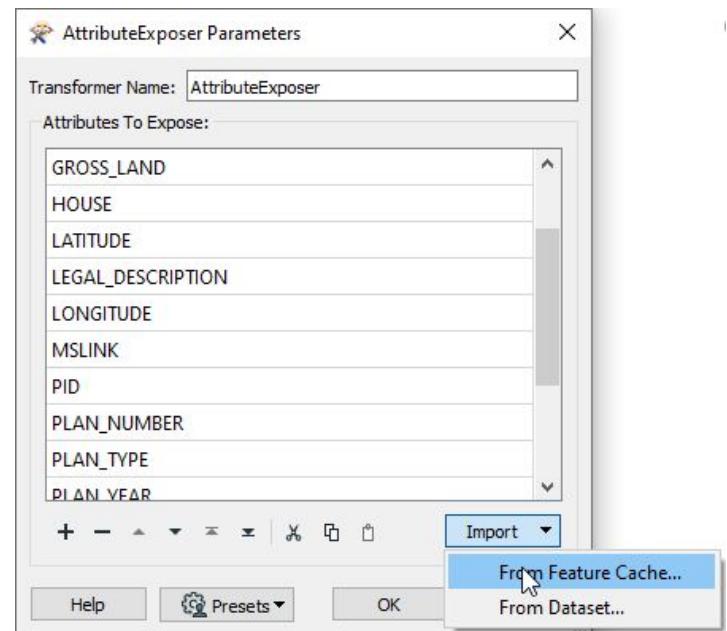

You don't have so just read data

Let Your Database Do The Work

Tips for SQLExecutor & SQLCreator

- Let your database do the work
 - You only load the data you need
- Needs all of your data is in a single database
- SQL - any level of SQL complexity
- Expose attributes if you need them in the workbench

InlineQuerier

- **Any data source** can be used
- Utilizes the power of SQL
- Join data in a temporary SQLite database
- Multiple queries

SQLCreator

- Used to execute SQL against a **database**
- Requires an incoming feature to trigger the SQL statement

SQLExecutor

- Used to execute SQL against a **database**
- No incoming feature required

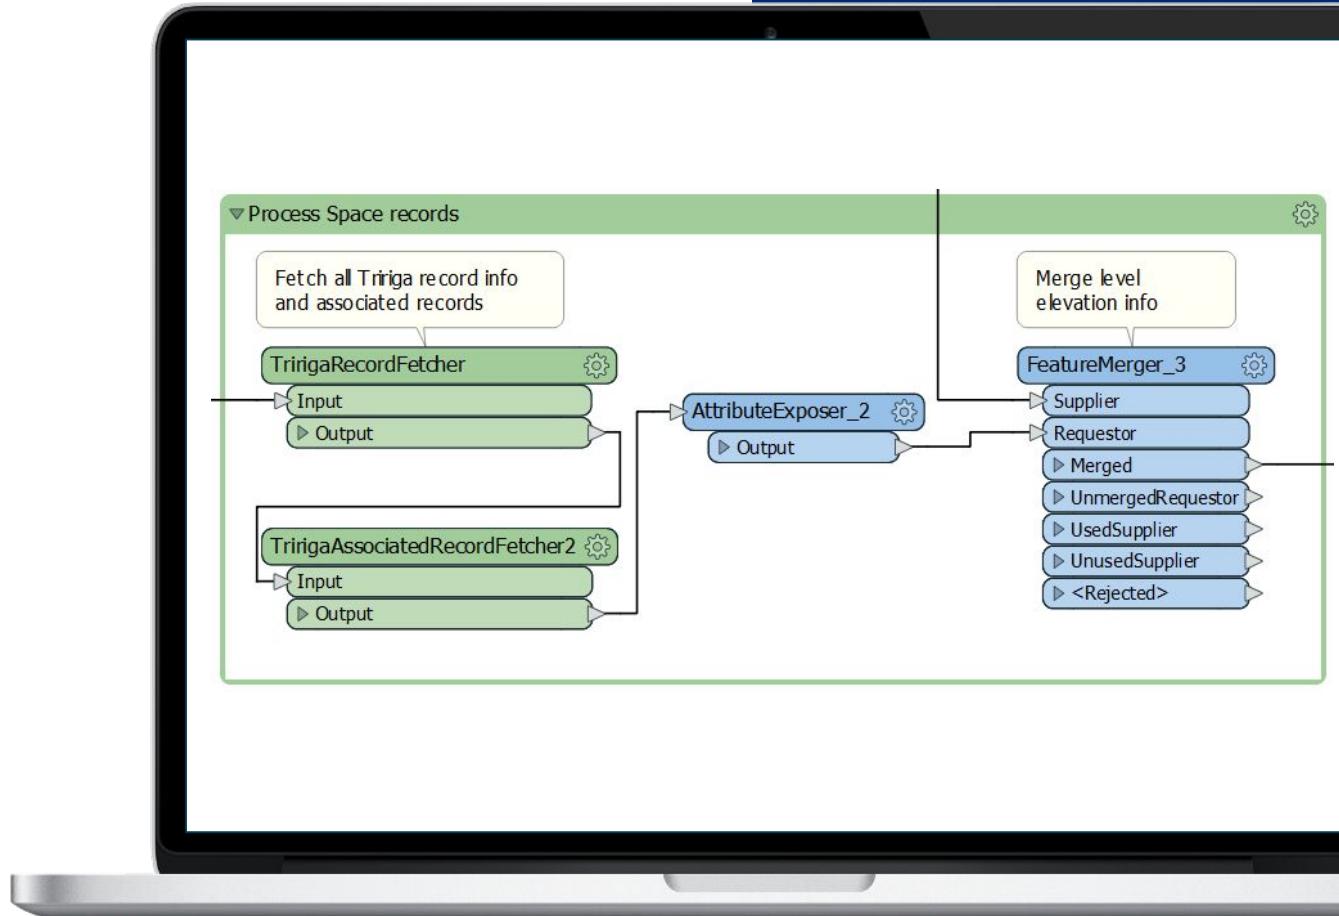

Other Join Ideas

Database views

with SQLExecutor or SQLCreator

API Joins

<ws:getAllAssociatedRecords>

A blue-toned landscape photograph of a mountain range. The foreground features a large, dark mountain peak with a complex wireframe overlay consisting of numerous white triangles, suggesting a digital model or network. In the background, other mountain peaks are visible under a clear blue sky.

Optional Exercise: HTML Report & Workspace App (FME Server)

Wrap Up...

A photograph of a person standing on the edge of a rocky mountain peak, their arms raised in triumph. They are wearing a dark shirt, blue jeans, and a red backpack. The background consists of a range of mountains partially obscured by low-hanging clouds or mist, creating a sense of depth and achievement.

Merging & Joining

CAN BE EASY!

**FME TRANSFORMERS
CAN DO THE WORK FOR YOU.**

Choose the right
Transformer to merge &
join data more efficiently.

Follow the Flow-Chart

Inspect your data and ask yourself:

1) Is all of my data already inside the workspace?

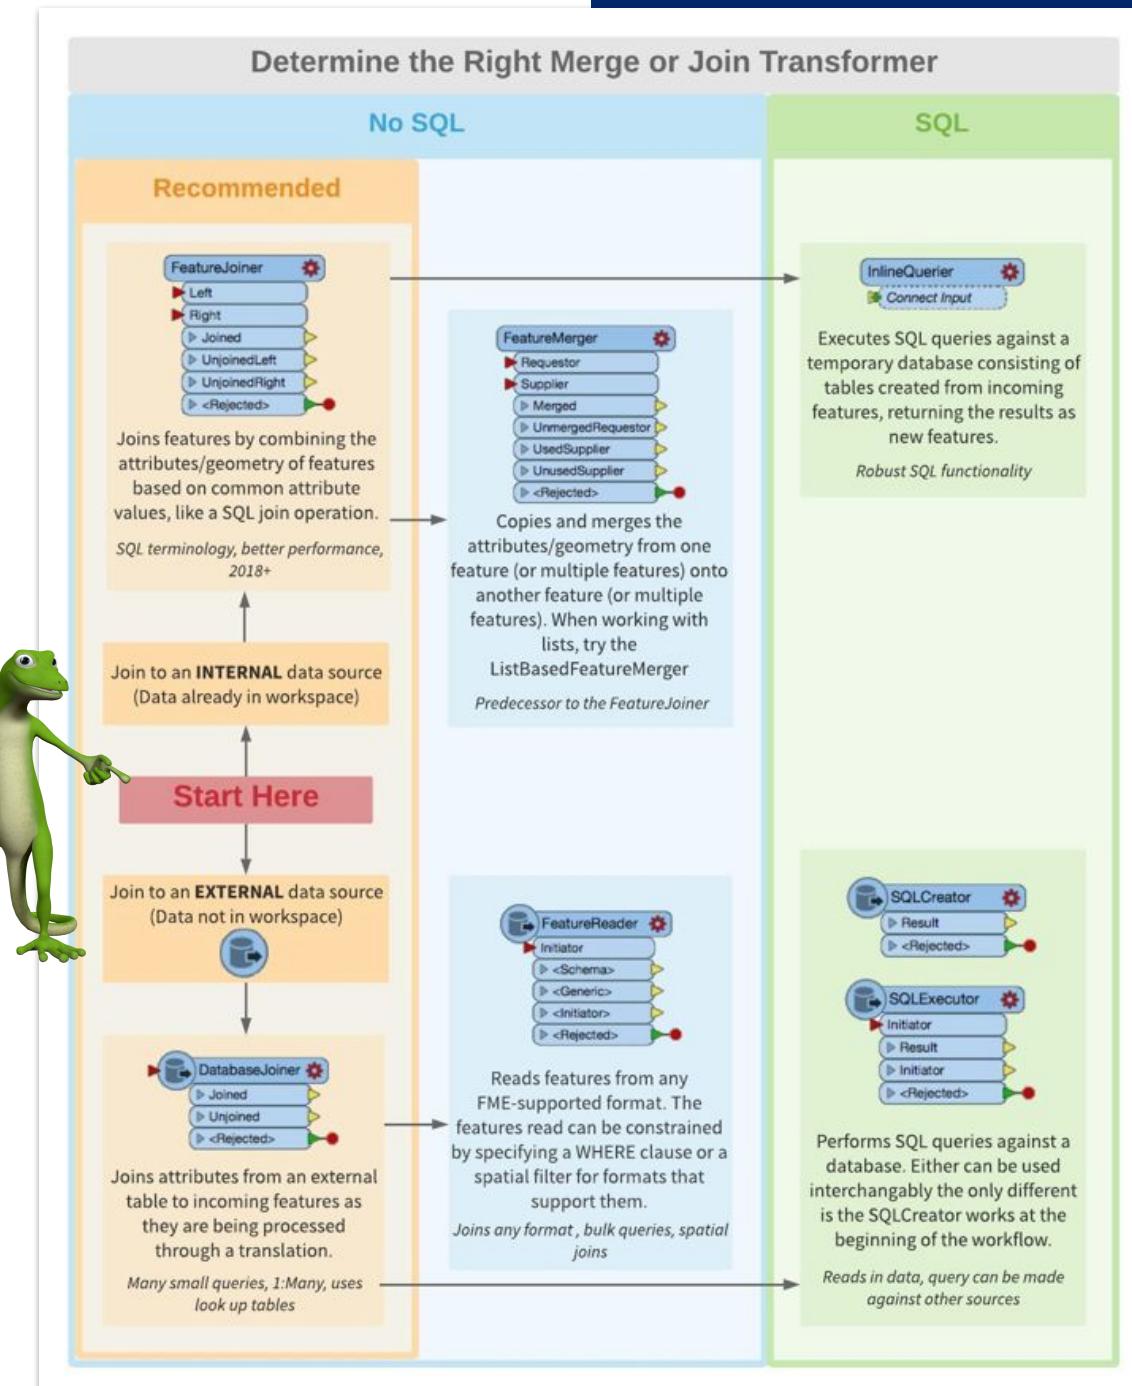

- If yes, follow the INTERNAL path
- If no, follow the EXTERNAL path

2) Does the FeatureJoiner for internal or DatabaseJoiner for external work for my data?

- If yes, Great! End here.
- If no, continue to question 3

3) Do I know or want to use SQL?

- If yes, see the transformers in the green SQL box
- If no, see the transformers in the blue box

**Integrate disparate
data with FME to
breakdown data silos**

Self directed training modules

A grid of twelve self-directed training modules from FME Academy. Each module is represented by a card with an icon, title, description, and points information.

 Module Analyze Spatial Data Conduct basic spatial analysis by comparing the location of features or filtering data based on location. +400 points ~40 mins	 Module Automate Workflows Save time by using FME to turn manual tasks into repeatable or event-based workflows. +500 points ~55 mins	 Module Build Basic Automations Learn the basics of FME Server Automations, which run workspaces on a schedule or in response to a trigger. +300 points ~30 mins
 Module Build Basic Self-Serve Workflows Turn your FME workspaces into self-service apps. +450 points ~40 mins	 Module Build Versatile Automations Run workspaces in response to changes in a file directory or incoming email. +510 points ~1 hr	 Module Build Versatile Self-Serve Workflows Give end-users control over how workspaces run on FME Server. +600 points ~1 hr
 Module Build a Shared Library of Custom Transformers Create a central library of custom transformers for reuse across multiple workspaces. +300 points ~40 mins	 Module Connect Automations with Job Orchestration Automate the execution of multiple workspaces in sequence or parallel. +600 points ~1 hr	 Module Connect To Data Learn to eliminate data silos and move data between different systems. +700 points ~1 hr

Thank You!
